

Getting Started > Session Management > Get Session

# Get Session

Once a user is logged in, you often want to get the session object in order to use the data in some way. A common use-case is to show their profile picture or display some other user information.

**Next.js**   Next.js (Client)   Qwik   SvelteKit   Express

**TS** ./components/UserAvatar.tsx

```
import { auth } from "../auth"

export default async function UserAvatar() {
  const session = await auth()

  if (!session?.user) return null

  return (
    <div>
      <img src={session.user.image} alt="User Avatar" />
    </div>
  )
}
```

If you'd like to extend your session with more fields from your OAuth provider, for example, please check out our ["extending the session" guide](#).
