Building upon our previous discussions and inspired by platforms like Goodreads, we aim to enhance our quotes website with advanced user interaction features. Below is a comprehensive guide detailing the required functionalities, scalability considerations, SEO optimization, and proposed milestones.

Website Requirements:

1. **User Accounts:**
   o Implement a robust user registration and authentication system, allowing users to create personal accounts.
   o Enable profile customization where users can upload avatars, write brief bios, and manage their settings.

2. **Favorite Quotes:**
   o Allow users to mark quotes as favorites, storing them in a dedicated section within their profile for easy access.
   o Provide options to organize favorite quotes into custom collections or categories.

3. **Following System:**
   o Enable users to follow other members to stay updated on their activities, such as new favorite quotes or comments.
   o Allow users to follow authors, receiving notifications when new quotes from these authors are added.

4. **Author Profiles:**
   o Create comprehensive author pages featuring:
      ▪ Biographical information.
      ▪ A curated list of their quotes.
      ▪ Related works or publications.
      ▪ A follower count and the option for users to follow the author.
   o Ensure each author page has an SEO-friendly URL structure, e.g., `domainname.ae/author/marcus-tullius-cicero`.

5. **User Interaction:**
   o Implement a commenting system under each quote to foster discussions.
   o Allow users to like or react to quotes and comments.
   o Provide a notification system to alert users about new comments, likes, or when followed authors/members add new content.

6. **Scalability and Performance:**
   o Design the system architecture to handle a growing number of users and data efficiently.
   o Optimize database queries and implement caching strategies to ensure quick data retrieval.

      o   Utilize Content Delivery Networks (CDNs) to serve static assets swiftly to a global audience.

7. **SEO Optimization:**
   - Ensure all URLs are descriptive and keyword-rich, e.g., `domainname.ae/motivation-quotes`.
   - Incorporate meta tags, alt texts for images, and structured data (Schema.org) for quotes and authors.
   - Generate XML sitemaps and submit them to search engines to facilitate better indexing.
